Proof of Concept

*Note: This feature has not yet been fully explored in IntelliJ IDE but is fully functional in VS Code. Please install VS Code to fully utilize all the features.

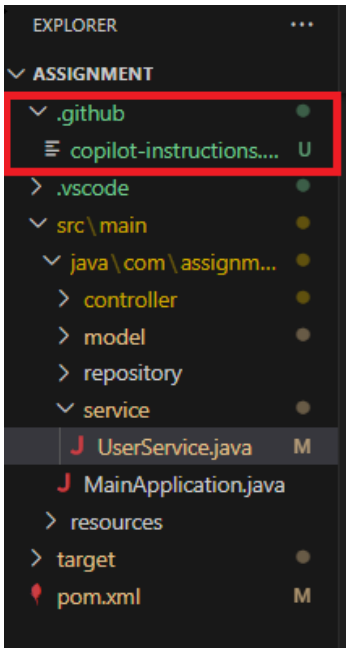
1) Instruction-Driven Code Generation using GitHub Copilot.

GitHub Copilot suggestions can be guided to follow team-specific coding standards by embedding context directly in code files.

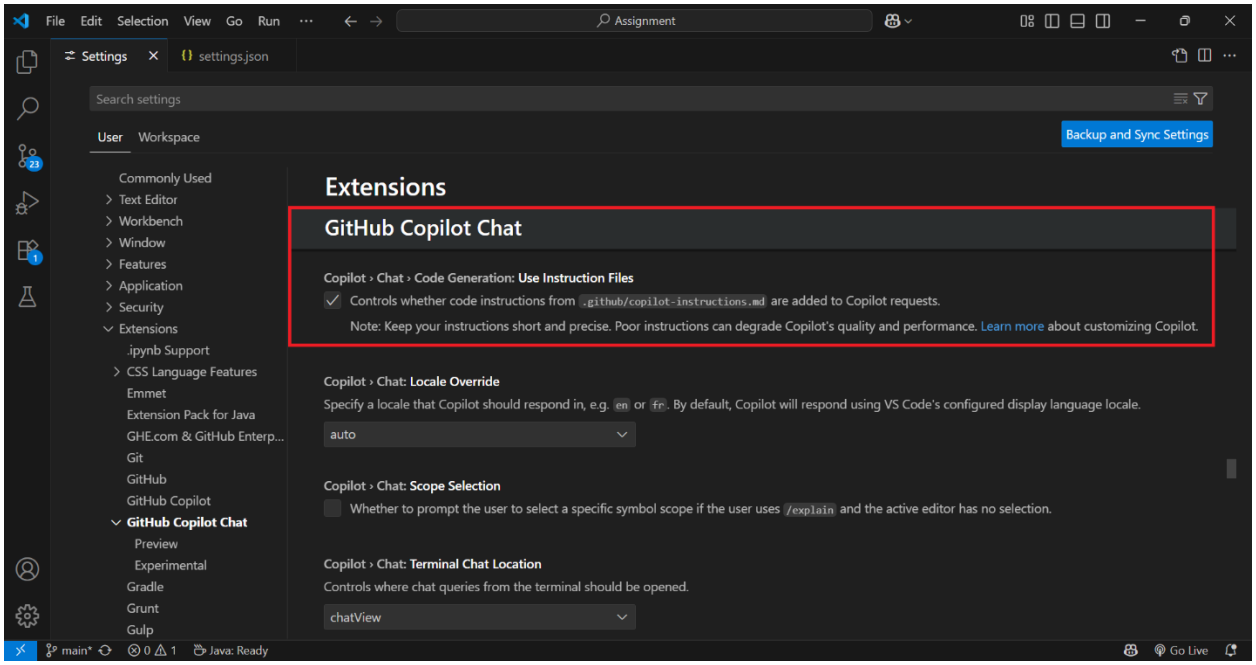
2) Setup Guide

i. Add “GitHub Copilot” and “GitHub Copilot Chat” plugin in VS Code.

ii. Add “.github/copilot-instructions.md” in the project root.



iii. Ensure that in settings,
“GitHub > Copilot > Chat > Code Generation: Use Instruction Files” is enabled.



Or, add these lines in “settings.json”

```
"github.copilot.chat.codeGeneration.instructions": [
    {
      "file": ".github/copilot-instructions.md"
    }
  ],
```

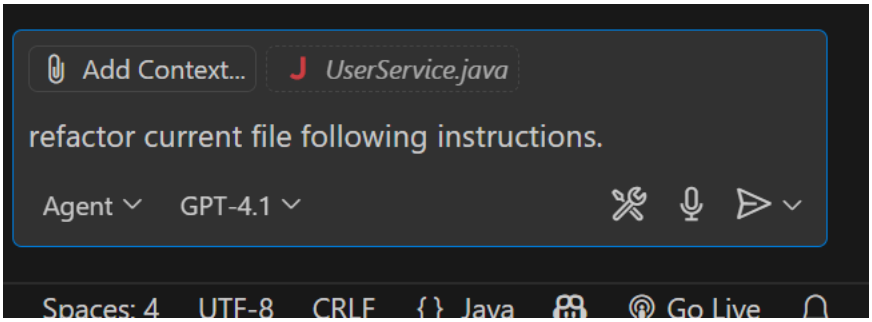
iv. List out the instructions, i.e., the specific code standards, conventions and patterns in the ‘copilot-instructions.md’ that copilot must adhere to.

v. Try to type the instructions in a clear and concise manner, provide examples as needed for better context quality. Example copilot-standards.md file is provided.

vi. Now, open GitHub Copilot Chat and toggle to Agent Mode. GitHub Copilot will automatically use this for instructions. You may give this file as reference as a fail-safe.

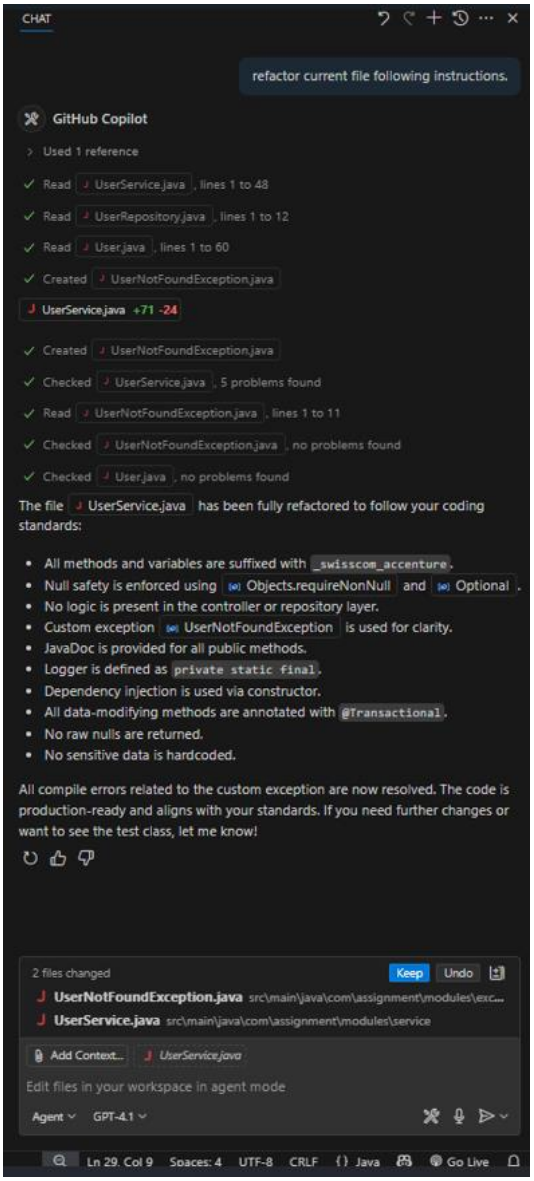
3) Demo

i. Now we can give prompts in Copilot Chat, Example prompt:



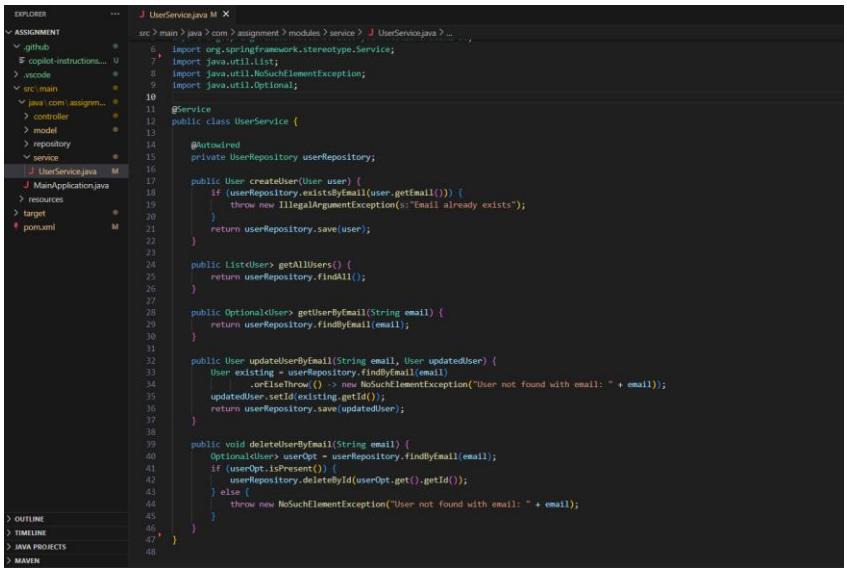
Copilot Agent refactored the code file following the instructions given in the copilot-instructions.md file.

ii. Response:



a. Pre-Refactor:

Deliberate mistakes have been made, so that Copilot can correct them. Example Code.



```java
import org.springframework.stereotype.Service;
import java.util.List;
import java.util.NoSuchElementException;
import java.util.Optional;

@Service
public class UserService {

    @Autowired
    private UserRepository userRepository;

    public User createUser(User user) {
        if (userRepository.existsByEmail(user.getEmail())) {
            throw new IllegalArgumentException(s:"Email already exists");
        }
        return userRepository.save(user);
    }

    public List<User> getAllUsers() {
        return userRepository.findAll();
    }

    public Optional<User> getUserByEmail(String email) {
        return userRepository.findByEmail(email);
    }

    public User updateUserByEmail(String email, User updatedUser) {
        User existing = userRepository.findByEmail(email)
                .orElseThrow(() -> new NoSuchElementException("User not found with email: " + email));
        updatedUser.setId(existing.getId());
        return userRepository.save(updatedUser);
    }

    public void deleteUserByEmail(String email) {
        Optional<User> userOpt = userRepository.findByEmail(email);
        if (userOpt.isPresent()) {
            userRepository.deleteById(userOpt.get().getId());
        } else {
            throw new NoSuchElementException("User not found with email: " + email);
        }
    }
}
```

b. Post-Refactor:

a) Insertions by Copilot are in yellow and Deletions are in red.

CHAT
refactor current file following instructions.
GitHub Copilot
Used 1 reference
Read UserService.java , lines 1 to 48
Read UserRepository.java , lines 1 to 12
Read User.java , lines 1 to 60
Created UserNotFoundException.java
UserService.java +71 -24
Created UserNotFoundException.java
Checked UserService.java , 5 problems found
Read UserNotFoundException.java , lines 1 to 11
Checked UserNotFoundException.java , no problems found
Checked User.java , no problems found
The file UserService.java has been fully refactored to follow your coding standards:
All methods and variables are suffixed with _swisscom_accenture.
Null safety is enforced using Objects.requireNonNull and Optional .
No logic is present in the controller or repository layer.
Custom exception UserNotFoundException is used for clarity.
JavaDoc is provided for all public methods.
Logger is defined as private static final.
Dependency injection is used via constructor.
All data-modifying methods are annotated with @Transactional.
No raw nulls are returned.
No sensitive data is hardcoded.
All compile errors related to the custom exception are now resolved. The code is production-ready and aligns with your standards. If you need further changes or want to see the test class, let me know!
